

Smart Urban Community Resilience

Agentic, Auditable, Always-On

The Problem: (The “Before”)

“Delay kills. Confusion feeds chaos.”

Fragmented data sources and systems

Slow decision-making processes

Limited coordination between agencies

Average urban response delay: 10–15 mins

Lack of auditability and learning mechanisms

The Solution (The "After")

We're Building the Nervous System for the City.

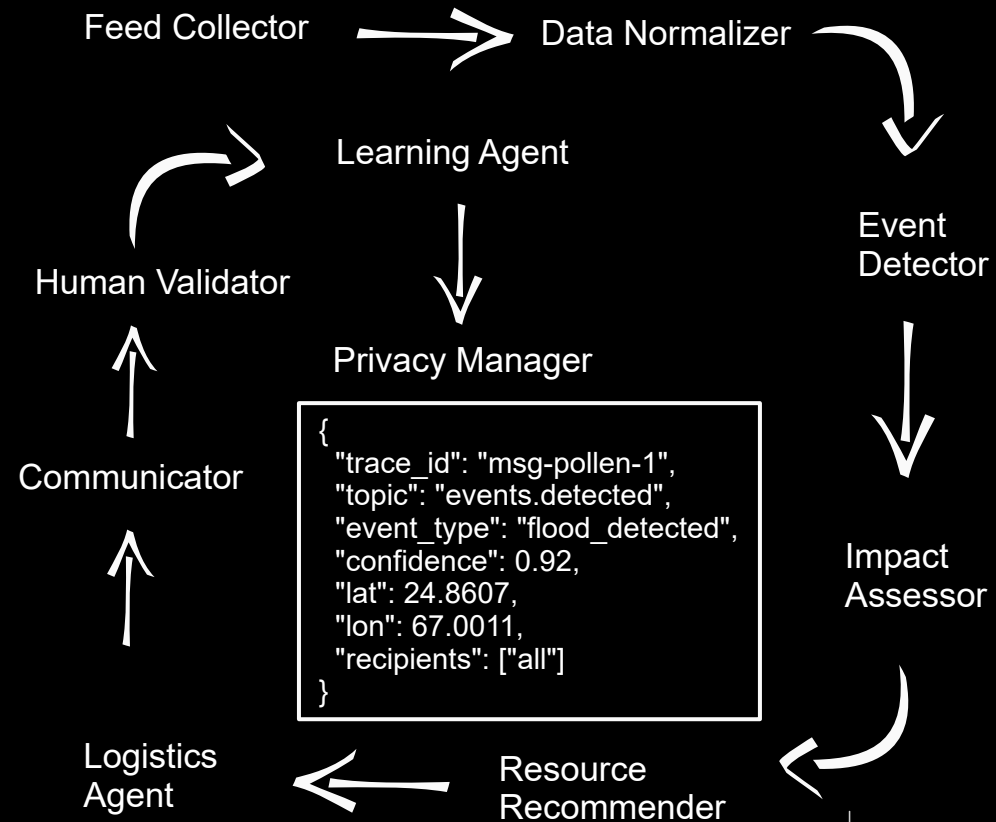

- 10 specialized AI agents (for now) working in coordination
- From data collection to automated response
- Human-in-the-loop validation for approving responses
- **Full auditability with evidence bundles**
- Continuous learning from every event

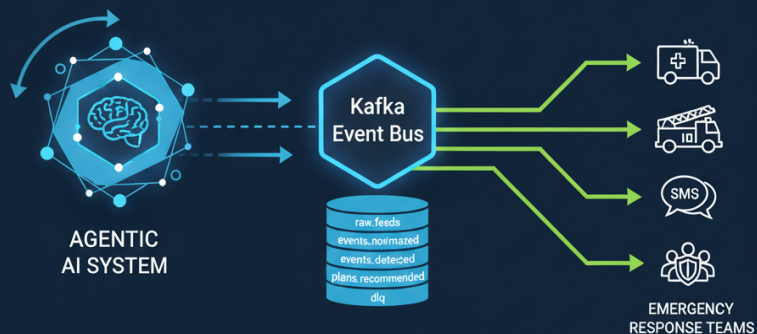

How it Works – Agentic Architecture

Make it Event Driven

Kafka enables replayable, event-driven coordination across all agents.

“Kafka ensures replayable event streams — this system never sleeps.”

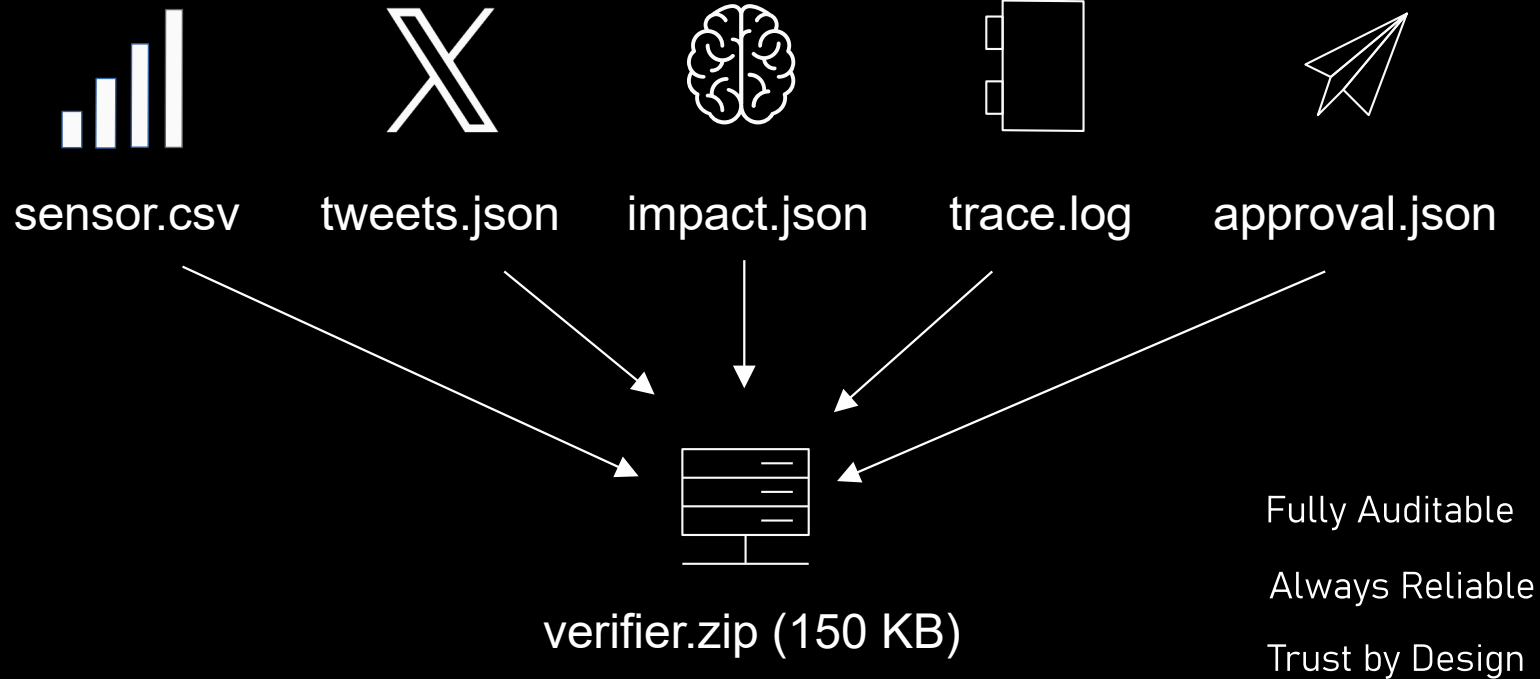

```
[
  {
    "id": "msg-flood-1",
    "channel": "sms",
    "body": "Flood Risk Alert for Suining County! Index 56. Be aware of localized flooding, especially in low-lying areas. Avoid flooded roads. Monitor local news for updates.",
    "recipients": ["Emergency Services", "all", "Public Works"]
  },
  {
    "id": "msg-pollen-1",
    "channel": "sms",
    "body": "High Tree Pollen Count (194) in Suining County. Allergy sufferers advised to limit outdoor activity and take precautions. Consult a doctor if symptoms worsen.",
    "recipients": ["all", "Health Services"]
  }
]
```

What sets this project apart.

- End-to-end agentic orchestration: Complete workflow automation
- Graceful degradation: System remains functional during outages
- Per-Exec Evidence bundles: Full audit trail for every decision
- Replayable event streams: Perfect for testing and post-event analysis
- Human-AI collaboration: Critical decisions validated by experts
- Privacy-first design: Built-in consent management and PII protection

The Secret Sauce

The Vision

- A redundant Event Driven System.
- Agentic Systems working around the clock, handling matters.
- Once a significant event occurs, the systems alters a topic It notifies the human supervisor for approval.
- Once approved, the actions will be executed.
